### Design

The fully automatic pressure booster system is equipped with two, three or four (SVP) vertical high-pressure pumps (2) (all of which are speed-controlled) for pumping the fluid handled to the consumer installations in the set pressure range.

### Function

Two, three or four (SVP) pumps (2) are controlled and monitored by motor-mounted frequency inverters.

As the demand increases or decreases, pumps are started and stopped automatically.

As soon as the demand increases again after one pump has been stopped, another pump which has not been in operation before is started up.

The stand-by pump is also included in the alternating cycle.

The standard setting is for the pressure booster system to start automatically as a function of pressure; the actual pressure is measured by an analog pressure transmitter.

As long as the pressure booster system is in operation, the pumps are started and stopped as a function of demand (standard setting). In this way it is ensured that the individual pumps operate only in line with actual demand.

The use of variable speed pumps reduces wear as well as the frequency of pump starts in parallel operation. If a duty pump fails, the next pump is started up immediately. A fault is output, which can be reported via volt-free contacts (e.g. to the control station).

If the demand drops towards 0, the pressure booster system slowly runs down to the stop point.

As standard, one of the pumps is on stand-by. The control system defines each of the pumps as stand-by pump in alternation. This prevents stagnation of water in any of the pumps. Via a parameter in the control system the stand-by pump function can be disabled in order to operate the system without stand-by function.

The pressure booster system is designed with integrated dry running protection.

The electrical connection cabinet contains digital contacts for a lack-of-water display.

### DeltaBasic:

During commissioning and after every power failure, the pressure booster system fills the piping system slowly to prevent any damage to the piping by surge pressure.

## Selection information

### Selection example

#### Requirements:

Required duty point:

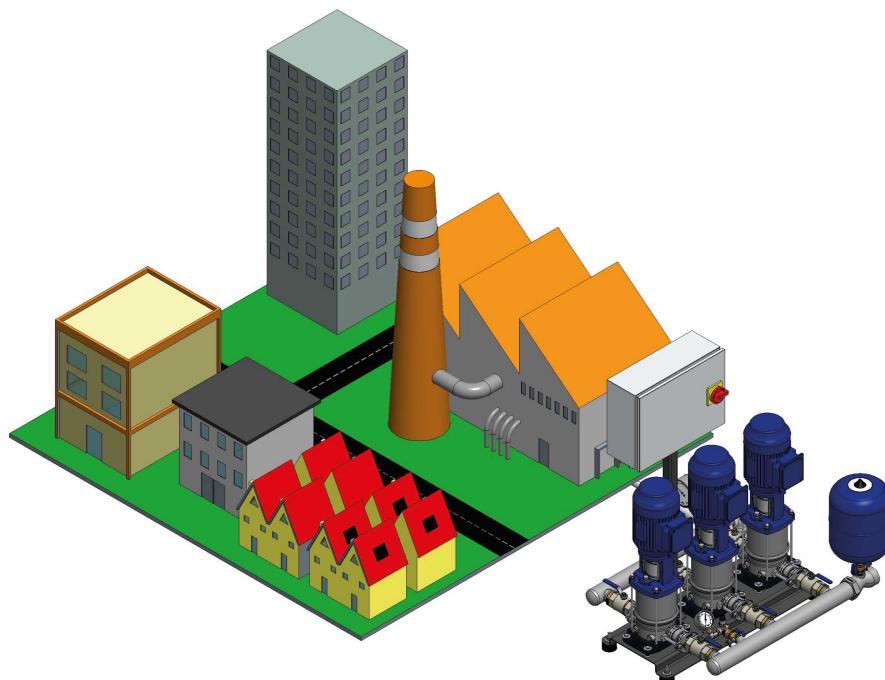

- 2 duty pumps and 1 stand-by pump
- Flow rate: 10 m<sup>3</sup>/h
- Head: 50 m
- Inlet pressure: 1 bar

#### Solution:

- Subtract the inlet pressure of 1 bar (approx. 10 m) from the head.  
⇒ This results in a required head of 40 m.
- Divide the flow rate required by the number of duty pumps. Transfer the values to the characteristic curves diagram to select the corresponding pump.  
⇒ This results in the selection of a DeltaBasic SVP/MVP 3/0605.
